Carnegie Mellon 2019

Pittsburgh, PA

Bachelor's Graphic Design

OCAD University 2013

Toronto, Canada

ClickUp · VP, Product Design & Research

2023 to present

Promoted Jan '26 · Sr. Director 2024–25

Product Design Manager 2023–24 · Sr. Product Designer 2023

I lead product design and research in close partnership with the CEO. I scaled design from 12 to 18 and research from 1 to 4 before reorganizing around a leaner team of 8 designers and 2 researchers. I run the org and stay close to the details, often shipping features myself.

Turning ClickUp into an AI-native work platform

- Led design across ClickUp's AI suite (including Brain, Super Agents, AI Fields, AI Summaries, Artifacts, and Skills) with three designers.
- Pushed pace & quality, aligned parallel teams by rapid prototyping, customer testing, and daily dogfooding. As a result, Brain adoption grew from 9.6% to 19.6% while improving M1 retention by 35%.
- AI revenue got healthier between Jan 2025 and Jun 2026: AI subscription ARR \$6.89M to \$40.73M (5.9x), with NDR crossing 100% (98.2% to 102.1%)

Leading the initiatives, owning the details

- Personally designed and shipped 135+ features to production as an IC and a design leader
- Led ClickUp 4.0, the largest redesign in company history, introducing a new visual language and navigation IA across Lists, Chat, Docs, and other core surfaces. Every risky change was tested qualitatively and quantitatively, while low-risk changes were shipped rapidly and dogfooded
- Overall product NPS rose 15 points to an all-time high. Task View shipped to 456K users at a 0.09% revert rate

Building internal AI-native tools for success, creativity & efficiency

- Built the internal workflows that changed how EPD works: research studies launched by agents from inside ClickUp, and live prototypes coded with agents, testable in minutes in the Prototype Playground
- Brought coding and productivity agents into the design team's daily practice. Designers now ship simple fixes straight to the frontend repo themselves
- Building a learning system that improves from human corrections and adjusts its agents, skills, rules, and design-system documentation

Building and growing teams

- Grew design 12 to 18 and research 1 to 4, with 6 promoted across both teams
- Iterated on recruiting practices: screening, hiring process, and quality bars
- Built career ladders, personalized career paths, and created a performance rubric on Craft, Collaboration, and Leadership
- Established the design rituals and continuous processes that enabled alignment, quality, and speed

'Nuffsaid · Head of Design

2022 to 2023

Acquired by ClickUp, backed by Google Ventures and General Catalyst

- Joined as Head of Design and second design hire, brought in to rebuild the design practice
- Owned product, design language, and vision for a universal inbox for customer success teams
- Set up a weekly iteration loop from insights to prototypes with a live customer advisory board, building deep customer empathy across the team. The continuous discovery loop revealed that we were building the wrong thing, so we pivoted and launched a new product from scratch within three months

Uber · Sr. Product Designer

2019 to 2022

Advanced Technologies Group (acquired by Aurora, 2021)

- Made complex tools more usable for ML engineers through human-centered design, leading user research and product design end-to-end across multiple autonomy teams
- Designed tools for log search and mining, map generation, and vehicle-data visualization used by mission specialists, triage teams, and autonomy developers

Bloomberg LP · Product Consultant

2019

- Designed the next-generation data annotation platform that Bloomberg's data scientists use to train more accurate machine learning models. It ensured annotation quality, streamlined annotation requests, and consolidated multiple annotation sources

Headspace · Product Consultant

2019

- Designed new mobile features aimed at the highest-attrition segment to lift weekend engagement

BlueDot · UX & Data Designer

2014 to 2018

- Designed and built ML tools to track and predict how infectious diseases spread, including 100+ data visualizations, one featured in The Economist
- Built the product 0 to 1 across vision, research, build, and release. Created the proof of concept behind a \$1M+ Air Canada partnership
- BlueDot later became the first in the world to flag COVID-19 ahead of the World Health Organization
